

Application Recovery Kit

Exchange Disaster Recovery

The SteelEye Protection Suite for Exchange from SIOS provides a comprehensive set of tools to address all areas of Exchange business continuity, including Exchange disaster recovery, data protection and high availability.

- Real-time CDP protects Exchange data and provides the highest RPO
- Classic failover and Exchange recovery
- Support for shared storage and Exchange data replication
- Complete monitoring of Exchange processes
- Support for Exchange 5.5, 2000, 2003 and 2007
- Standard or Enterprise versions supported

Exchange disaster recovery is often the worst nightmare of an Exchange administrator. The recovery process takes significant time and planning and is generally very hard to test. In addition to the downtime involved, Exchange recovery could involve a substantial amount of data loss due to the fact that the databases need to be restored from the latest available backup. Using the SteelEye Protection Suite for Exchange, you are able to easily and quickly resume operations in the event of a disaster with little to no data loss.

SteelEye Protection Suite for Exchange was the first commercially available clustering solution for Exchange back in 1998 for Exchange 5.5 running on Windows NT4 and continues to be the leader in both the breadth and depth of Exchange disaster recovery and HA.
